Nested transactional memory (TM) facilitates software composition by letting one module invoke another without either knowing whether the other uses transactions. **Closed nested transactions** extend isolation of an inner transaction until the toplevel transaction commits. Implementations may flatten nested transactions into the top-level one, resulting in a complete abort on conflict, or allow partial abort of inner transactions. **Open nested transactions** allow a committing inner tran ...

2 [Concurrency control issues in nested transactions](#)

Theo Härder, Kurt Rothermel

 January 1993 **The VLDB Journal — The International Journal on Very Large Data Bases**, Volume 2 Issue 1

Publisher: Springer-Verlag New York, Inc.

 Full text available: ☒ [pdf\(1.90 MB\)](#)

 Additional Information: [full citation](#), [abstract](#), [references](#), [citations](#)

The concept of nested transactions offers more decomposable execution units and finer-grained control over concurrency and recovery than "flat" transactions. Furthermore, it supports the decomposition of a "unit of work" into subtasks and their appropriate distribution in a computer system as a prerequisite of intratransaction parallelism. However, to exploit its full potential, suitable granules of concurrency control as well as access modes for shared data are necessary. In this article, we in ...

3 Concepts for transaction recovery in nested transactions

Theo Haerder, Kurt Rothermel

December 1987 **ACM SIGMOD Record , Proceedings of the 1987 ACM SIGMOD international conference on Management of data SIGMOD '87**, Volume 16 Issue 3

Publisher: ACM Press

Full text available: [pdf\(1.14 MB\)](#)

Additional Information: [full citation](#), [abstract](#), [references](#), [citations](#), [index terms](#)

The concept of nested transactions offers more decomposable execution units and finer grained control over recovery and concurrency as compared to 'flat' transactions. To exploit these advantages, especially transaction recovery has to be refined and adjusted to the requirements of the control structure. In this paper, we investigate transaction recovery for nested transactions. Therefore, a model for nested transaction is introduced allowing for synchronous and asynchronous tran ...

4 Failure isolation and recovery in composite multidatabases

Dexter P. Bradshaw

October 1994 **Proceedings of the 1994 conference of the Centre for Advanced Studies on Collaborative research CASCON '94**

Publisher: IBM Press

Full text available: [pdf\(193.89 KB\)](#)

Additional Information: [full citation](#), [abstract](#), [references](#), [citations](#), [index terms](#)

Most concurrency control schemes for guaranteeing global serializability in composite multidatabase systems are susceptible to rollbacks. Conservative schemes generate rollbacks because of transaction timeouts, while those of optimistic schemes are caused by certification failures. Typically, rollbacks on any branch of a flat distributed transaction cause a global abort. Global aborts during multidatabase composition degrade performance because of a waste of resources and reductions in multidata ...

5 A nested transaction model for multilevel secure database management systems

Elisa Bertino, Barbara Catania, Elena Ferrari

November 2001 **ACM Transactions on Information and System Security (TISSEC)**, Volume 4 Issue 4

Publisher: ACM Press

Full text available: [pdf\(560.96 KB\)](#)

Additional Information: [full citation](#), [abstract](#), [references](#), [citations](#), [index terms](#)

This article presents an approach to concurrency control for transactions in a Multilevel Secure Database Management System (MLS/DBMS). The major problem is that concurrency control mechanisms used in traditional DBMSs are not adequate in a MLS/DBMS, since they may be exploited to establish covert channels. The approach presented in this article, which uses single-version data items, is based on the use of nested transactions, application-level recovery, and notification-based locking protocols. ...

In this paper we propose a model of a database that could become a kernel of cooperative database applications. First, we propose a new data model CDM (Collaborative Data Model) that is oriented for the specificity of multiuser environments, in particular: cooperation scenarios, cooperation techniques and cooperation management. Second, we propose to apply to databases supporting collaboration so called multiuser transactions. Multiuser transactions are flat transactions in ...

Processes are increasingly being used to make complex application logic explicit. Programming using processes has significant advantages but it poses a difficult problem from the system point of view in that the interactions between processes cannot be controlled using conventional techniques. In terms of recovery, the steps of a process are different from operations within a transaction. Each one has its own termination semantics and there are dependencies among the different steps. Regarding c ...

Additional Information: [full citation](#), [abstract](#), [references](#), [index terms](#)

Transaction processing has emerged as the killer application for commercial servers. Most servers are engaged in transactional workloads such as processing search requests, serving middleware, evaluating decisions, managing databases, and powering online commerce. Currently, commercial servers are built from one or more high-performance superscalar processors. However, commercial server applications exhibit high cache miss rates, large memory footprints, and low instruction level parallelism (IL ...
